

Instructions: S3 Bucket & Data (Simple Rules)

1. Buckets (what each one is for)

- Pictures / profile photos bucket: mployee-data-bucket
- Data (JSON files) bucket: dataauh
- CDK bucket name: _____

2. Uploading DATA (employees)

You upload a JSON file into the data bucket (dataauh)

JSON MUST follow these rules:

Required fields (for NEW people)

- EmployeeID → must be unique
- FirstName
- LastName

Example JSON file (for testing)

```
[
{
  "EmployeeID": "123",
  "FirstName": "John",
  "LastName": "Doe",
  "Title": "Engineer",
  "DepartmentName": "IT",
  "Email": "john@example.com",
  "SendInvite": true
}
]
```

Rules

a) If EmployeeID does NOT exist → system will **CREATE** new employee

- must have FirstName + LastName
- if missing → skipped

b) If EmployeeID already exists → system will **UPDATE** that employee

- Only fields you include will change
- Everything else stays the same

c) Picture rule

- If no picture is given → system uses default:
- default profile picture automatically added

d) Names are auto fixed

System automatically creates:

- lowercase first name

- lowercase last name

3. Uploading PICTURES

- Upload images to:** mployee-data-bucket
- Image link:** "Picture": "https://mployee-data-bucket.s3.amazonaws.com/image.png"

4. SEARCH (how API works)

You can search by:

- **First name:** ?FirstName=john
- **Last name:** ?LastName=doe
- **Full name:** ?FirstName=john&LastName=doe
- **Position / Title:** **Position**=engineer OR **Title**=engineer

Search Rules

- Must include **at least ONE**
 - FirstName OR LastName OR Position
- Search is:
 - **case-insensitive**
 - **partial match for Title**
 - "eng" → finds "Engineer"

5. Testing Steps

1. Create JSON file
2. Upload to dataauh bucket
3. Wait for system to process
4. Check:
 - DynamoDB updated
 - Employees added/updated
